

“It’s like putting an administrative assistant in every truck. On-Route provides the optimum path to efficient navigation, communication, billing and customer service. And while helping improve route operations, it quietly collects information to take productivity tracking and reporting to a level of accuracy unattainable until now.”

Mick Baker
Waste-Tech Expo 2005

Save on fuel and labor costs

On-Route warns the driver if a service is missed or out of sequence preventing costly return trips. And the **Navigator** route service map display cuts the learning time for new and temporary drivers.

Improve driver productivity

The driver sees exactly where to go and what to do next. The **Navigator** map shows the real-time truck position on the route with images that show service type and status. Standard pickups automatically record date, time and location for “proof of service”, while problems can be recorded by simply touching the **Service Exception** buttons.

Connect the office and the driver

On-Route continuously reports truck position and service status to the office while dispatched service changes are quickly sent to the truck computer. The **Dispatch Desk** displays service status, and can split routes or re-route to cover breakdowns.

Increase driver safety

No more missed cell phone calls or forgotten instructions to distract the driver while trying to navigate traffic. **Message Manager** provides instant text messaging displayed on the map next to the service location.

Reduce customer service calls

Customer Service representatives report that half the calls are asking when they will be serviced. Now customers can go to the **Online Customer Service Manager** to see service times, delays and even the reason they were missed. Here they can have the option to re-schedule the service.

Lower truck maintenance costs

On-Route uses GPS to continuously record truck acceleration, speed and braking data. Route playback reports provide color coded driving profiles to show how adjusting driving habits can reduce wear and tear on the truck.

Designed and backed by industry leader, Alpine Technology

On-Route has been specifically designed from the start to meet the special demands and harsh environments of the Waste Industry. Our design team evaluated the actual driving conditions and observed the challenges faced by drivers. As with all our **Waste Management Technology** solutions, we continue to research ways to improve **On-Route** to help businesses become more efficient.

Total integration is a key factor to saving valuable time in the office. **On-Route** talks directly with our premiere waste office management system, **Visual RAMS-Pro**, to automatically produce route lists including up to the minute changes and dispatches. It also takes care of billing extra services and notifies the proper personnel to resolve service issues. Combine the time saved in the office and on the route to that of fuel and maintenance, and you'll find an exceptionally quick return on investment and faster profitability.

The table below provides the ability to evaluate the importance of each **On-Route** feature. Score a 1 for not important and 10 for very important. The last column is provided to compare another product.

On-Route feature	Rating	Other
Moving map helps driver navigate the route and clearly see service images		
Map calculates and shows shortest route between stops		
Driver is warned about "out of sequence" and missed pickups		
Service proximity sensing automatically records normal service		
Records date, time, speed, bearing and signal quality every second		
Driver can re-sequence pickups		
Driver can record "Not Outs"		
Definable Exception buttons that trigger automatic office system billings		
Exception buttons that notify a person/department to resolve service issue		
Driver can photograph service issues		
Photos can become part of customer's account		
Online Customer Service website approximates service time		
Online re-scheduling for problem services		
Absolute proof of service to eliminate billing disputes		
Download all routes so trucks can be redirected to help with other routes		
Up to the minute dispatches sent to the route		
Service Point Instant Messaging (service dispatches, etc...)		
General Instant Messaging (landfill closed, road conditions, etc...)		
Office Dispatch Desk shows truck location and service status		
Dispatch Desk allows instant re-routes		
Dispatch Desk can be viewed remotely even when out of office		
Multiple users can view Dispatch Desk		
Speed zone reports show driving profiles and reduce maintenance costs		
Productivity & Profitability reports		
Integrates fully with office system		
Designed specifically for the Waste Industry		
Length of time the software developer been in business		
Uses common off-the-shelf products instead of proprietary hardware		
Environmentally Rugged Equipment		
Lowest Hardware Price		
Lowest Software Price		
Lowest Maintenance Cost
